

To: Hacking Division
From: [REDACTED]
Subject: Hacking MoneyCorp's website
Date: October 8, 2022

In order to break into the main offices of Money Corp, we should endeavour to *gain access to the admin account of their website and disable whatever security you find.*

The Website

You can find Money Corp's website at `z3account.github.io`.

Security History

Financial records indicate that Money Corp initially outsourced their security to the lowest bidder, in this case a corporation named 'Legit-Security'

More recently, Money Corp was required to undergo a security evaluation after a data breach where courts ruled Money Corp's poor security for user data was in violation of GDPR. The penetration testing team they got in seems to be legitimate and Money Corp may be in the process of upgrading their security. As such, time of the essence.

Legit-Security

Legit-Security are a security organisation known for producing poor security infrastructure which ticks boxes but fails to provide any real security.

We know that their security 'specialist' *Freeman Payne* is in charge of current work for Money Corp, along with several lower down employees - *Larry Bennett*, *Gwenda Boon*, and likely more.

Potential Users

All employees are likely to have accounts on the website, including the contractors from Legit-Security. It should be stressed that these users - especially the ones lower down the command chain - have low morale and are unlikely to have put much effort into securing their accounts (weak passwords, confidential information emailed without proper encryption, etc). This applies doubly so to the contractors, despite their backgrounds in security.

Resources

You're encouraged to use any popular search engine (such as *google.com*, *duckduckgo.com*, or *askjeeves.net*) if and when you're in need of technical tools or information.

Remember not to panic or overthink. This task can be completed without a hacking background.
